EDUCATION

Northeastern University – Khoury College of Computer Sciences

Sep 2022 - June 2026

Bachelor of Science in Computer Science, Minor in International Affairs

Boston, MA

- **GPA:** 3.7/4.0, Dean's List Recipient
- **Relevant Coursework:** Fundamentals of Software Engineering, Algorithms & Data, Object-Oriented Design, Database Design, Web Development, Theory of Computation, Programming Languages
- **Activities:** TA for Fundamentals of CS 1, Girls Who Code, NU Women in Tech, Husky Hackathon

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, JavaScript, SQL, C#, VB.NET, HTML, CSS

AI/Agents: LangGraph, LangChain, OpenAI API, Anthropic API

Frameworks: React, Next.js, NestJS, Spring, Flask, GraphQL

Infrastructure: Docker, Kubernetes, AWS, Terraform, PostgreSQL, Supabase, Kafka, Liquibase, Jenkins, Buildkite

EXPERIENCE

Proviras

March 2026 - Present

Co-founder & Software Engineer

Boston, MA

- Founded Proviras, a platform that helps AI agent teams cut LLM costs without sacrificing quality by shadow-testing cheaper models against production traffic and surfacing measured downgrade recommendations.
- Built a TypeScript SDK (published on npm) that hooks into LangGraph agent flows to capture LLM calls and stream them to a dashboard for analysis; shadow-testing engine launching September 2026.
- Reached 500+ npm downloads since SDK launch in May 2026.

Wayfair

July 2025 - December 2025

Software Engineer Co-op

Boston, MA

- Led the migration of ticketing functionality from a 500k+ line monolithic order-processing system into a standalone Java service using Spring, GraphQL, and Kafka, containerized with Docker, deployed via Kubernetes (k8s) with pod-based configurations, and integrated with a Buildkite CI/CD pipeline.
- Provisioned a new PostgreSQL database and backfilled data from legacy Spanner tables using Liquibase.
- Implemented Keycloak authentication with service accounts and Vault secrets, while refactoring legacy workflows to reduce ticket creation time by 75% (8 min to less than 2 min) and cut build times by ~40%.

Student Government Association of Northeastern University

February 2024 - December 2025

Technical Lead & Software Engineer

Boston, MA

- Led a team of 8 engineers in developing a senator nomination and application website for 15,000+ students and 500+ SGA members, owning the full lifecycle from architecture decisions through deployment.
- Designed and implemented the site using TypeScript, React, HTML, CSS, NestJS, and a Supabase backend, then deployed the platform with Docker pipelines to ensure functionality and scalability across environments.
- Managed weekly Agile sprints, created development tickets, conducted peer reviews, and ensured timely delivery.

Riverside Research

July 2024 - December 2024

Software Engineer Co-op

Centreville, VA

- Contributed to the full software development lifecycle for radar and satellite-related defense systems in C# and VB.NET; designed, implemented, and deployed new features via Jenkins pipelines.
- Identified and resolved data mismatches between government and internal databases, improving query performance by 18% and reducing data retrieval times for satellite and radar system features.

PROJECTS

Truffle | Python, LangGraph, Anthropic API

- Built an open-source agent that surfaces unposted startup job opportunities by ingesting hiring signals from Hacker News and YC, classifying real openings, and ranking them against a candidate profile.
- Designed as an 8-node LangGraph flow with parallel source fetchers and conditional routing across classification, extraction, scoring, and summarization LLM calls, outputting a daily digest.

NoShow | TypeScript, React, Supabase (Postgres + Auth + Realtime), Vite

- Built a peer-to-peer marketplace for trading fitness class spots, with a preference-based waitlist for claiming.
- Implemented a smart matching engine with Supabase Realtime that routes posted spots to the best-fit seeker and advances the queue if unclaimed within 30 minutes, secured by RLS across four Postgres tables.
